## Algorithm for computing $E_G(s)$

**Input:** A Digraph  $G$  in adjacency list representation, a vertex  $s \in V(G)$ ; a marking number  $p \in \mathbb{N}$

1. Set  $\text{mark}[s] := p$  and  $\text{mark}[v] := \text{nil} \ \forall v \in V \setminus \{s\}$
2.  $L := (s)$
3. **while**  $L \neq \emptyset$  **do**
4.     Delete the first element  $u$  from  $L$ .
5.     **for all**  $v \in \text{Adj}[u]$  **do**
6.         **if**  $\text{mark}[v] = \text{nil}$  **then**
7.             Set  $\text{mark}[v] := p$  and add  $v$  to the end of  $L$ .
8.         **end if**
9.     **end for**
10. **end while**
11. **return**  $E_G(s) := \{v \in V : \text{mark}[v] = p\}$

# Acyclic Graph

## Definition

A graph is called *acyclic* if it has no simple cycle.

# Topological Sorting

## Defition

A *topological sorting* of a directed graph  $G = (V, R, \alpha, \omega)$  is a bijection  $\sigma : V \rightarrow \{1, 2, \dots, n\}$  such that  $\forall r \in R$

$$\sigma(\alpha(r)) < \sigma(\omega(r))$$

# Condition for Acyclic

## Theorem

$G$  has a topological sorting iff  $G$  is acyclic.

## Proof $\Leftarrow$

If  $G$  has a cycle  $C = (v_0, \dots, v_k)$  then  $G$  cannot have a topological sorting since then:

$$\sigma(v_0) < \sigma(v_1) < \dots \sigma(v_k) = \sigma(v_0)$$

# Topological Sorting

Proof  $\Rightarrow$

The proof is by induction. For,  $n = 1$  it is trivial. Let  $n > 1$ .

Let  $G$  be acyclic.

Then there is atleast one  $\tilde{v} \in V$  with no outgoing edges.

By induction,  $G - \tilde{v}$  has a topological sorting  $\sigma'$ . For  $v \in V$  we set

$$\sigma(v) = \begin{cases} 1 & v = \tilde{v} \\ \sigma'(v) + 1 & v \neq \tilde{v} \end{cases}$$

# Algorithm for Topological Sort

**Input:** A Digraph in adjacency list representation.

1. Compute the indegrees  $\text{igrad}[v]$  for all  $v \in V$ .
2. Set  $L_0 := \{v \in V : \text{igrad}[v] = 0\}$ .
3. **for**  $i = 1, \dots, n$  **do**
4.   Delete the first vertex  $v_i$  from  $L_0$  and set  $\sigma(v_i) = i$ .
5.   **for all**  $r \in \delta^+(v_i)$  **do**
6.     Let  $w = \omega(r)$  the endvertex of  $r$ ,  $\text{igrad}[w] := \text{igrad}[w] - 1$ .
7.     **if**  $\text{igrad}[w] = 0$  **then**
8.       Add  $w$  to  $L_0$
9.     **end if**
10.   **end for**
11. **end for**
12. **return**  $\sigma$

# Bipartite Graphs

## Definition

A graph  $G$  is *bipartite* if there is a partition  $V(G) = A \dot{\cup} B$  such that every arc had one end vertex in  $A$  and the other in  $B$ .

## Theorem

An undirected graph  $G$  is bipartite iff  $G$  has no cycle of odd length.
